Section 1: Case Summary

Scenario Title:	Polytrauma in Urban ED
Keywords:	Trauma, head injury, shock, airway
	Blunt polytrauma presents to urban ED with requirement for airway, head injury
Brief Description of Case:	and hemorrhagic shock management

Goals and Objectives				
Educational Goal:	Appropriate application of ATLS principles in a tertiary centre			
Objectives: (Medical and CRM)	 Recognize key elements of pre-arrival history and make specific preparations for care based on this information Apply a stepwise, organized ATLS approach to a trauma patient Recognize the need for airway management in an unstable trauma patient Resuscitate with blood products in a timely fashion Ensure appropriate use of imaging and consulting services available in a tertiary care setting 			
EPAs Assessed:				

Learners, Setting and Personnel						
Target Learners:	☑ Junior Learners		⊠ Senior Learners		☐ Staff	
	☐ Physicians	□ Nurses		☐ RTs		Inter-professional
	☐ Other Learners:					
Location:	⊠ Sim Lab ⊠ In Situ				☐ Other:	
Recommended Number of Facilitators:	Instructors: 1					
	Sim Actors: n/a- appropriately equipped mannequin					
or racilitators.	Sim Techs: 1					

Scenario Development			
Date of Development:	September 2023		
Scenario Developer(s):	Dr. Trystan Nault, Dr. Jeanne Macleod

Last Revision Date:	N/A		
Revised By:	-		
Version Number:	2		

Section 2A: Initial Patient Information

		A.	Patient Chart		
Patient Name: John Driver			Age: 35	Gender: M	Weight: 70kg
Presenting complaint: Rollover MVC					
Temp: 36.7	HR:120	BP:95/60	RR: 24	O ₂ Sat: 94%	FiO ₂ : -
Cap glucose: 5.6 GCS: 9 (E2 V3 M4)					
Triage note:					
Allergies: unkn	own				
Past Medical Hi unknown			Current Medi	cations: unknown	

Section 2B: Extra Patient Information

A. Further History

Include any relevant history not included in triage note above. What information will only be given to learners if they ask? Who will provide this information (mannequin's voice, sim actors, SP, etc.)? – per EHS:

Rollover MVC, belted, airbags deployed. Not ejected. No other passengers, no other vehicles. Extricated easily upon arrival. Possible head injury, GCS initially 12 at scene.

Complaining of severe left hip/pelvic pain.

1L fluid given, IV access x1.

B. Physical Exam				
List any pertinent positive and negative findings				
Cardio: tachy. Pale. Decreased pulses left leg.	Neuro: CS: 9 (E2 V3 M4)			
Resp: Airway patent, speaking at first. Good air entry	Head & Neck: bruising to Lt temple. PERL 3mm. C			
bilaterally without adventitia. No flail chest. Trachea	collar applied.			
midline.				
Abdo: nil. Negative FAST.	MSK/skin: Bruising over left hip/pelvis. decreased			
	pulses in left leg.			
Other: Extremities cool				

Section 3: Technical Requirements/Room Vision

A. Patient				
☑ Mannequin (specify type and whether infant/child/adult) Adult, standard.				
☐ Standardized Patient				
☐ Task Trainer				
☐ Hybrid				
B. Special Equipment Required				
Airway equipment (VL/DL, size 8 ET tube, stylet, boujee, OPA, bag valve mask, ETCO2 hookup, suction)				
C spine collar				
Sheet/pelvic binder				
C. Required Medications				
Blood, TXA, Ketamine, Rocuronium, Fentanyl				
D. Moulage				
D. Wodrage				
None required				
None required				
E. Monitors at Case Onset				
☐ Patient on monitor with vitals displayed				
☑ Patient not yet on monitor				
F. Patient Reactions and Exam				
Include any relevant physical exam findings that require mannequin programming or cues from patient				
(e.g. – abnormal breath sounds, moaning when RUQ palpated, etc.) May be helpful to frame in ABCDE format.				
Initially inappropriate, confused words-then changing to moaning, no words following initial primary survey				

Section 4: Sim Actor and Standardized Patients

	Sim Actor and Standardized Patient Roles and Scripts					
Role	Description of role, expected behavior, and key moments to intervene/prompt learners.					
	Include any script required (including conveying patient information if patient is unable)					
EHS						
	Rollover MVC, belted, airbags deployed. Not ejected. No other passengers, no other vehicles. Extricated easily upon arrival. Possible head injury, GCS initially 12 at scene.					
	Complaining of severe left hip/pelvic pain.					
	1L fluid given, unable to obtain IV access.					

Section 5: Scenario Progression

Scenario States, Modifiers and Triggers					
Patient State/Vitals	Patient Status	Learner Actions, Modifiers & Triggers to Move to Next State	Facilitator Notes		
Pre-Arrival		Expected Learner Actions Scenario will allow up to an extra 2 minutes of pre-arrival time in which preparations can be made based on the initial EHS story. Such preparations can include: - Prepping airway equipment and drugs (induction, paralytic) - Activating MTP or getting blood ready (see facilitator notes) - Activating the Trauma team, prepping imaging modalities etc - Placing a pelvic binder onto the bed - Preparing other medications such as TXA - Outlining team structure and roles	Regarding MTP/blood products: - If ordered, please prompt stating that they need to specify initial ratios and amounts of blood products for this patient as well as any other specific monitoring/logistical aspects of giving blood products that are important in trauma - Ideally: 4 units prbc, 4 units plasma, 1 dose platelets (can use uncrossmatched prbc's in the interim) - Especially in the prehospital phase, preparing a Rapid Infuser will allow for warming FFP, prbc and quicker administration overall when the patient arrives - Frequent temperature checks are critical to		

1. Baseline State Rhythm: Sinus Tach HR: 120 BP: 95/60 RR: 24	Patient initially speaking but quite confused, inappropriate.	Expected Learner Actions Bring patient into trauma bay activate MTP, assign task of monitoring this process (see	Modifiers Changes to patient condition based on learner action - improved hypotension with fluids/blood—can't give unless	prevent hypothermia and exacerbate blood loss and shock in these cases
O ₂ SAT: %94	pain. Localizing	facilitator notes)	IO/IV access obtained	
T: °C 36.7 GCS: 9	to pain. Initially complaining of pain to Lt hip. Arrives in a C collar. (GCS 9 E2V3M4)	activate trauma team Order 1g TXA (mention that another 1g needed in the next 8h) systemic approach through primary survey discussion of airway management, reasoning herecan wait, want to resuscitate first	-improved hypotension with binder Triggers For progression to next state - completion of primary survey or above interventions	
2. Nursing states they are having trouble getting an IV	Patient remains as previous, continues to c/o pain to Lt hip.	Expected Learner Actions Recognize the need for prompt access to resuscitate Understand the preferred location for IO/IV trauma and	Modifiers - If supradiaphragmatic line isn't obtained, even if fluids/blood given, VS as follows and suggestion	

Rhythm: Sinus Tach		particularly this case where	from nursing/facilitator	
HR: 120		1 .	that alternative access	
		pelvicinjury is a concern-		
BP: 95/60		humeral IO, subclavian or IJ CVC	may be more effective	
RR: 24				
O ₂ SAT: %94			HR: 125	
T: °C 36.7			BP: 85/50	
GCS: 9			RR: 24	
			O₂SAT: %94	
			T: °C 36.7	
			GCS: 9	
			333.3	
			Triggors	
			Triggers	
			- Adequate IO/IV access is	
			obtained	
3.	Patient to moan	Expected Learner Actions	<u>Modifiers</u>	
	about pelvis	Place a pelvic binder	-see VS column	
If 1 unit PRBC given	hurting again	Give Blood products to treat		
with binder:	here	shock- see facilitator notes		
HR: 110		regarding ratios, Rapid Infuser	<u>Triggers</u>	
BP: 100/65			- again, either completion of	
RR: 24			primary survey or above actions	
O ₂ SAT: %94			- if primary survey complete and	
			, , , ,	
I T: ºC 36.7			multiple units of blood given	
T: °C 36.7			multiple units of blood given without pelvic binder, move on to	
T: °C 36.7 GCS: 9			without pelvic binder, move on to	
GCS: 9				
GCS: 9 If 2 units PRBC given			without pelvic binder, move on to	
GCS: 9 If 2 units PRBC given with binder:			without pelvic binder, move on to	
GCS: 9 If 2 units PRBC given			without pelvic binder, move on to	

RR: 24 O ₂ SAT: %94 T: °C 36.7 GCS: 9 If blood given without binder, transient improvement in hypotension and tachycardia – but ultimately refractory, with vs returning to: HR: 120 BP: 95/60 RR: 24 O ₂ SAT: %94 T: °C 36.7 GCS: 9				
4. VS as in the previous column based on learner actions- with GCS now 7	Patient no longer opening their eyes, moaning incomprehensib ly – GCS 7	Expected Learner Actions identify need for definitive airway with deteriorating LOC-GCS now 7 (E1V2M4) Intubate the patient manage shock with blood products, identify unbound pelvis if refractory	Modifiers - Pupils now 5mm, fixed bilaterally - Poor respiratory effort, requiring supplemental O2 and Bagging to maintain sats -if intubation attempted despite unbound pelvis, ongoing	

			hypotension-successful, but VS now: HR 120 BP 80/50 RR20 Sat 95% T36.7 -If intubation attempted with bound pelvis, after blood products: HR 110 BP 110/70 RR20 Sat 95% T36.7	
			<u>Triggers</u> -successful intubation	
See Modifiers column	ET Tube placed	Expected Learner Actions continue to resuscitate with blood products- if stable, call off MTP as appropriate identification of conditions that would make it safe to leave the trauma bay to go for imaging disposition – imaging, consultants (CT head to pelvis, IR, Neurosurgery, ICU)	Modifiers - If pelvis is bound already, VS as in above column HR 110 BP 110/70 RR20 Sat 95% T36.7 - If pelvis is bound or blood given during this stage, VS: HR 110 BP 100/70 RR20 Sat 95% T36.7 - If pelvis remains unbound, blood products given: HR 115 BP 90/70 RR20 Sat 95% T36.7	- Can consider a que such as- nursing is asking if the patient is ready to go for imaging, the scanner is ready

	- if pelvis unbound and they go for imaging: patient arrests in the scanner
	Triggers - Learner states patient can go to scanner

Appendix A: Laboratory Results

Cardiac/Coags
Trop 10
D-dimer 479
INR 1.2
aPTT 47
<u>Biliary</u>
AST 32
ALT 20
GGT 17
ALP 55
Bili 15
Lipase 10
<u>Tox</u>
EtOH <2
ASA -ve
Tylenol -ve
<u>Other</u>
B-HCG -ve

Appendix B: ECGs, X-rays, Ultrasounds and Pictures

Paste in any auxiliary files required for running the session. Don't forget to include their source so you can find them later!

CXR (radiopedia)

Pelvic Xray (if asked for) (radiopedia):

Appendix C: Facilitator Cheat Sheet & Debriefing Tips

Include key errors to watch for and common challenges with the case. List issues expected to be part of the debriefing discussion. Supplemental information regarding any relevant pathophysiology, guidelines, or management information that may be reviewed during debriefing should be provided for facilitators to have as a reference.

Prehospital

- Given hypotension, mechanism discussed, it wouldn't be wrong to activate Trauma team if available as well as blood products/MTP prior to arrival
- Ideally prepare a pelvic binder if possible, prior to transfer onto the stretcher
- If not given by EHS, 1g TXA should be prepared, given
- Organize team roles, consider calling RT for airway management

Airway

- Airway management is not immediately necessary here, and despite their tenuous status, they
 certainly will benefit from resuscitation with blood products prior to any induction is attempted
- They are oxygenating well enough, and while they may benefit from sedation and a secured airway to tolerate a scan, their hemodynamics need to be addressed first here. This serves to highlight the simultaneous nature of an ABC approach to trauma.
- Discuss induction agents and their potential harms in a hemodynamically unstable patient
- A C collar is already applied in this case but ensuring to be cautious and provide a collar in mechanisms like this is crucial. Maintaining inline stabilization during intubation is critical here.

Pelvis/hemorrhagic shock

- In this case, the patient is in shock secondary to hemorrhage-which should be presumed as the etiology in trauma patients
- Assessing for other causes including pneumothorax and tamponade are important differentials to consider in this case- here, cxr +/- pocus demonstrates neither of these causes
- Assessing pelvic stability is part of the initial circulation assessment and should not be overlooked as a potential source for life threatening hemorrhage.
- Whenever possible, even a simple sheet can be used to bind a pelvis prior to patie nt arrival
- Where should this binder be applied? Address misconceptions around iliac crests vs trochanteric application
- While it may be dramatic here for the patient to have potentially arrested in the scanner, it underscores the importance of a complete primary survey and a thorough understanding of sources of potentially significant hemorrhage- which include chest, abdomen, pelvis, long bones, floor and retroperitoneum
- Regarding resuscitation, generous administration of blood products should be a first ap proach here with our hypotensive patient.

Blood product administration

- Again, based upon the initial story and VS, not wrong to have blood products ready in the pre-hospital preparation

- Elaborating on MTP- depending on the site, this may not be protocolized and it is important to understand the ratios in which this is done-4 U prbc: 4 FFP: 1 platelets. In this case, they do not end up requiring substantial prbc beyond what is initially available in many ED's.
- Recognize that many ED's have uncrossmatched blood available-important to know how much and how quickly further blood can be accessed. Based on this story, not wrong to suspect that more than 2-4 units may be required.
- Administration of blood products via Rapid Infuser is critical as it will appropriately warm products prior to administration and ensure timely administration. Getting this ready prior to arrival is a great step that can be taken in this case.
- Frequent temperature checks are important when blood products are being given and generally in trauma settings to prevent hypothermia which can exacerbate blood loss and shock

Head injury

- Recognize the deterioration of the patient from GCS 9 to 7, now with blown pupils, requiring bagging
- Identify the need for airway management, imaging, and potentially neurosurgical intervention
- Can discuss the role of neuroprotective intubation here vs prioritizing maintaining hemodynamics
- Discuss role for normocarbia, maintaining oxygenation, HOB elevation etc.

Imaging

- Attempting to have this shocky patient somewhat more stable for scanner is an important learning point here. Adequate resuscitation and thorough evaluation for causes of shock, sources of hemorrhage is important.
- For a patient with this mechanism and expected injuries (head, pelvis), ensuring a full trauma scan (head, C spine, Chest, abdomen, pelvis) is ordered is key

Disposition

- Recognize that this patient will need admission to ICU
- Discuss the role for gen surg vs IR to address pelvicinjury resulting in hemorrhagic shock
- Recognize that this patient is deteriorating from a head injury and likely requires neurosurgical intervention-there is a lot to cover in this case already and facilitators can consider including a CT demonstrating an epidural hemorrhage given the temporal hematoma or simply discuss this in broader terms.
